## EE24BTECH11024 - G. Abhimanyu Koushik

## **Question:**

Solve the differential equation  $\frac{d^2y}{dx^2} + 1 = 0$  with initial conditions y(0) = 0 and y'(0) = 0 **Solution:** 

Variable	Description
$c_1$	First Integration constant
$c_2$	Second Integration constant
n	Order of given differential equation
$a_i$	Coeefficient of <i>i</i> th derivative of the function in the equation
С	constant in the equation

TABLE 0: Variables Used

Theoritical Solution:

$$\frac{d^2y}{dx^2} + 1 = 0\tag{0.1}$$

$$\frac{d^2y}{dx^2} = -1\tag{0.2}$$

$$\int \frac{d^2y}{dx^2} dx = \int -1dx \tag{0.3}$$

$$\frac{dy}{dx} = -x + c_1 \tag{0.4}$$

$$\int \frac{dy}{dx} dx = \int (-x + c_1) dx \tag{0.5}$$

$$y = \frac{-x^2}{2} + c_1 x + c_2 \tag{0.6}$$

(0.7)

Substituting the initial conditions gives

$$y(0) = 0 \implies \frac{-0^2}{2} + c_1 0 + c_2 = 0$$
 (0.8)

$$c_2 = 0 \tag{0.9}$$

$$y'(0) = 0 \implies -0 + c_1 = 0$$
 (0.10)

$$c_1 = 0 \tag{0.11}$$

The theoritical solution is  $f(x) = \frac{-x^2}{2}$ 

Computational Solution:

Consider the given linear differential equation

$$a_n y^n + a_{n-1} y^{n-1} + \dots + a_1 y' + a_0 y + c = 0$$
 (0.12)

Where  $y^i$  is the *i*th derivative of the function then

$$y'(t) = \lim_{h \to 0} \frac{y(t+h) - y(t)}{h}$$
 (0.13)

$$y(t+h) = y(t) + hy'(t)$$
 (0.14)

Similarly

$$y^{i}(t+h) = y^{i}(t) + hy^{i+1}(t)$$
(0.16)

$$y^{n-1}(t+h) = y^{n-1}(t) + hy^{n}(t)$$
(0.17)

$$y^{n-1}(t+h) = y^{n-1}(t) + h\left(-\frac{a_{n-1}}{a_n}y^{n-1} - \frac{a_{n-2}}{a_n}y^{n-2} - \dots - \frac{a_0}{a_n}y - \frac{c}{a_n}\right)$$
(0.18)

(0.19)

Where i ranges from 0 to n-1 Discretizing the steps gives us

$$y_{k+1} = y_k + hy_k' (0.20)$$

$$y'_{k+1} = y'_k + hy''_k (0.21)$$

$$y_{k+1}^{n-2} = y_k^{n-2} + h y_k^{n-1} (0.23)$$

$$y^{n-1}(t+h) = y^{n-1}(t) + h\left(-\frac{a_{n-1}}{a_n}y^{n-1} - \frac{a_{n-2}}{a_n}y^{n-2} - \dots - \frac{a_0}{a_n}y - \frac{c}{a_n}\right)$$
(0.24)

where k ranges from 0 to number of data points with  $y_0^i$  being the given initial condition. For the given question

$$y(t+h) = y(t) + hy'(t)$$
 (0.25)

$$y'(t+h) = y'(t) + hy''(t)$$
 (0.26)

$$y_{k+1} = y_k + hy_k' (0.27)$$

$$y'_{k+1} = y'_k + hy''_k (0.28)$$

$$y'_{k+1} = y'_k - h (0.29)$$

Record the  $y_k$  for  $x_k = lowerbound + kh$  and then plot the graph. The result will be as given below.
