EE24BTECH11024 - G. Abhimanyu Koushik

Question:
Solve the differential equation $\frac{d^2y}{dx^2} = y$ with initial conditions $y(0) = 1$ and $y'(0) = 0$
Solution:
Theoritical Solution:
Laplace Transform definition

$$\mathcal{L}(f(t)) = \int_0^\infty e^{-st} f(t)\, dt \tag{0.1}$$

Properties of Laplace tranform

$$\mathcal{L}(y'') = s^2 \mathcal{L}(y) - sy(0) - y'(0) \tag{0.2}$$

$$\mathcal{L}(1) = \frac{1}{s} \tag{0.3}$$

$$\mathcal{L}(cf(t)) = c\mathcal{L}(f(t)) \tag{0.4}$$

$$\mathcal{L}(f(t)) = F(s) \implies \mathcal{L}\left(e^{at} f(t)\right) = F(s-a) \tag{0.5}$$

Applying the properties to the given equation

$$y'' - y = 0 \tag{0.6}$$

$$\mathcal{L}(y'') - \mathcal{L}(y) = 0 \tag{0.7}$$

$$s^2 \mathcal{L}(y) - sy(0) - y'(0) - \mathcal{L}(y) = 0 \tag{0.8}$$

$$\tag{0.9}$$

Substituting the initial conditions gives

$$\left(s^2 - 1\right)\mathcal{L}(y) = s \tag{0.10}$$

$$\mathcal{L}(y) = \frac{s}{s^2 - 1} \tag{0.11}$$

$$\mathcal{L}(y) = \frac{1}{2(s+1)} + \frac{1}{2(s-1)} \tag{0.12}$$

$$y = \frac{1}{2}\left(\mathcal{L}^{-1}\left(\frac{1}{s+1}\right) + \mathcal{L}^{-1}\left(\frac{1}{s-1}\right)\right) \tag{0.13}$$

$$y = \frac{1}{2}\left(e^{-x} + e^x\right)u(x) \tag{0.14}$$

The theoritical solution is

$$f(x) = \frac{1}{2}\left(e^{-x} + e^x\right)u(x) \tag{0.15}$$

We can arrive at a difference equation by applying Bilinear Z-transform on the Laplace equations. Take

$$s = \frac{2}{T}\left(\frac{1-z^{-1}}{1+z^{-1}}\right) \tag{0.16}$$

Here $T = h$

$$Y(z) = \frac{1}{2}\left(\frac{1}{\frac{2}{T}\left(\frac{1-z^{-1}}{1+z^{-1}}\right)+1} + \frac{1}{\frac{2}{T}\left(\frac{1-z^{-1}}{1+z^{-1}}\right)-1}\right) \tag{0.17}$$

$$Y(z) = \frac{1}{2}\left(\frac{T\left(1+z^{-1}\right)}{2\left(1-z^{-1}\right)+T\left(1+z^{-1}\right)} + \frac{T\left(1+z^{-1}\right)}{2\left(1-z^{-1}\right)-T\left(1+z^{-1}\right)}\right) \tag{0.18}$$

$$Y(z) = \frac{1}{2}\left(\frac{T\left(1+z^{-1}\right)}{(T-2)z^{-1}+(T+2)} - \frac{T\left(1+z^{-1}\right)}{(T+2)z^{-1}+(T-2)}\right) \tag{0.19}$$

$$\alpha_1 = -\frac{T-2}{T+2} \tag{0.20}$$

$$\alpha_2 = -\frac{T+2}{T-2} \tag{0.21}$$

$$Y(z) = \frac{T}{2(T+2)}\left(\frac{1}{1-\alpha_1 z^{-1}} + \frac{z^{-1}}{1-\alpha_1 z^{-1}}\right) - \frac{T}{2(T-2)}\left(\frac{1}{1-\alpha_2 z^{-1}} + \frac{z^{-1}}{1-\alpha_2 z^{-1}}\right) \tag{0.22}$$

The radius of convergence of $\frac{1}{1-\alpha_1 z^{-1}}$ and $\frac{z^{-1}}{1-\alpha_1 z^{-1}}$ is $|z| > |\alpha_1|$ and radius of convergence of $\frac{1}{1-\alpha_2 z^{-1}}$ and $\frac{z^{-1}}{1-\alpha_2 z^{-1}}$ is $|z| > |\alpha_2|$

The radius of convergence of $Y(z)$ is $max\left(|\alpha_1|, |\alpha_2|\right)$

Applying the inverse Z-transform with some rearrangement gives

$$\left(1-\alpha_1 z^{-1}\right)\left(1-\alpha_2 z^{-1}\right)Y(z) = \frac{T}{2}\left(1+z^{-1}\right)\left(\frac{1-\alpha_2 z^{-1}}{T+2} - \frac{1-\alpha_1 z^{-1}}{T-2}\right) \tag{0.23}$$

$$\left(1-(\alpha_1+\alpha_2)z^{-1}+z^{-2}\right)Y(z) = \frac{T}{2}\left(\frac{1-(\alpha_2-1)z^{-1}-\alpha_2 z^{-2}}{T+2}\right) \\ -\frac{T}{2}\left(\frac{1-(\alpha_1-1)z^{-1}-\alpha_1 z^{-2}}{T-2}\right) \tag{0.24}$$

$$z^2 Y(z) - z(\alpha_1+\alpha_2)Y(z) + Y(z) = \frac{T}{2}\left(\left(\frac{z^2-(\alpha_2-1)z-\alpha_2}{T+2}\right) - \left(\frac{z^2-(\alpha_1-1)z-\alpha_1}{T-2}\right)\right) \tag{0.25}$$

$$z^2 Y(z) - z(\alpha_1+\alpha_2)Y(z) + Y(z) - z^2 y[0] - zy[1] - z(\alpha_1+\alpha_2)y[0]$$

$$+z^2 y[0] + zy[1] + z(\alpha_1 + \alpha_2)y[0] = \frac{T}{2}\left(\left(\frac{z^2 - (\alpha_2 - 1)z - \alpha_2}{T + 2}\right) - \left(\frac{z^2 - (\alpha_1 - 1)z - \alpha_1^3}{T - 2}\right)\right)$$

$$(0.26)$$

$$y_{n+2} - (\alpha_1 + \alpha_2)y_{n+1} + y_n + \delta[n+2]y[0] + \delta[n+1](y[1] + (\alpha_1 + \alpha_2)y[0]) =$$
$$\frac{T}{2}\left(\delta[n+2]\left(\frac{1}{T+2} - \frac{1}{T-2}\right) - \delta[n+1]\left(\frac{\alpha_1 - 1}{T - 2} + \frac{\alpha_2 - 1}{T + 2}\right) + \delta[n]\left(\frac{\alpha_1}{T - 2} - \frac{\alpha_2}{T + 2}\right)\right)$$

$$(0.27)$$

Since $n \geq 0$, $\delta[n+2] = 0$ and $\delta[n+1] = 0$

$$y_{n+2} - (\alpha_1 + \alpha_2)y_{n+1} + y_n = \frac{T}{2}\left(\frac{\alpha_1}{T - 2} - \frac{\alpha_2}{T + 2}\right)\delta[n] \qquad (0.28)$$

As $y[0] = 1$ from initial condition and

$$y[1] = y(0) + hy'(0) \qquad (0.29)$$

$$(0.30)$$

Hence $n \geq 2$ which gives the difference equation as

$$y_{n+2} = (\alpha_1 + \alpha_2)y_{n+1} - y_n \qquad (0.31)$$

Computational Solution:
The given differential equation is

$$y'' - y = 0 \qquad (0.32)$$

Let

$$y' = y_1 \qquad (0.33)$$

$$y = y_2 \qquad (0.34)$$

Then

$$\frac{dy_1}{dx} = y_2 \qquad (0.35)$$

$$\frac{dy_2}{dx} = y_1 \qquad (0.36)$$

$$\int_{y_{1,k}}^{y_{1,k+1}} dy_1 = \int_{x_k}^{x_{k+1}} y_2 dx \qquad (0.37)$$

$$\int_{y_{2,k}}^{y_{2,k+1}} dy_2 = \int_{x_k}^{x_{k+1}} y_1 dx \qquad (0.38)$$

Discretizing the steps using trapezoidal rule gives us

$$y_{1,k+1} - y_{1,k} = \frac{h}{2}(y_{2,k} + y_{2,k+1}) \qquad (0.39)$$

$$y_{2,k+1} - y_{2,k} = \frac{h}{2}(y_{1,k} + y_{1,k+1}) \qquad (0.40)$$

Then solving for $y_{1,k+1}$ and $y_{2,k+1}$ in terms of $y_{1,k}$, $y_{2,k}$ and h will help us to calculate the

value of function at x_{k+1}

$$y_{1,k+1} = y_{1,k} + \frac{h}{2}\left(y_{2,k} + \left(y_{2,k} + \frac{h}{2}\left(y_{1,k} + y_{1,k+1}\right)\right)\right) \tag{0.41}$$

$$y_{1,k+1} = y_{1,k}\left(1 + \frac{h^2}{4}\right) + y_{2,k}h + y_{1,k+1}\left(\frac{h^2}{4}\right) \tag{0.42}$$

$$y_{1,k+1}\left(1 - \frac{h^2}{4}\right) = y_{1,k}\left(1 + \frac{h^2}{4}\right) + y_{2,k}h \tag{0.43}$$

$$y_{1,k+1} = \frac{(y_{1,k})\left(4 + h^2\right) + 4h\,(y_{2,k})}{4 - h^2} \tag{0.44}$$

Similarly

$$y_{2,k+1} = \frac{(y_{2,k})\left(4 + h^2\right) + 4h\,(y_{1,k})}{4 - h^2} \tag{0.45}$$

The difference equations are

$$y_{1,k+1} = \frac{(y_{1,k})\left(4 + h^2\right) + 4h\,(y_{2,k})}{4 - h^2} \tag{0.46}$$

$$y_{2,k+1} = \frac{(y_{2,k})\left(4 + h^2\right) + 4h\,(y_{1,k})}{4 - h^2} \tag{0.47}$$

Using the above formula, recording the value of y at each value of $x_k = x_0 + kh$ and taking $y(0) = 1$ and $y'(0) = 0$ and plotting gives
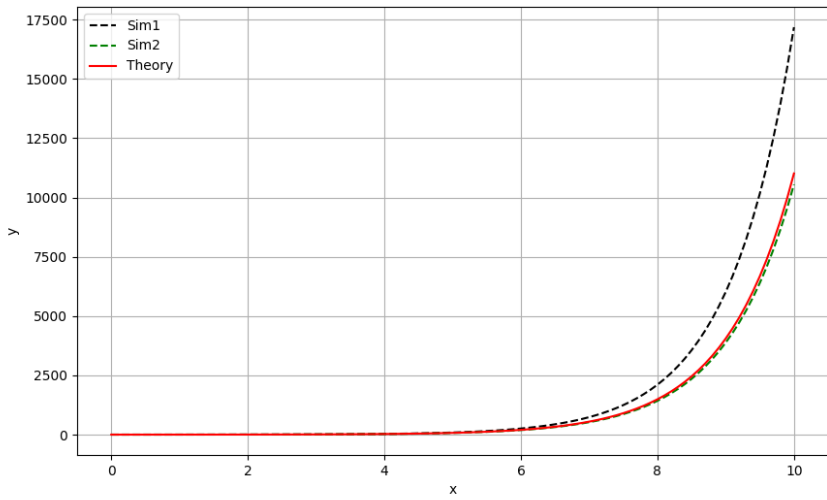

Fig. 0.1: Comparison between the Theoritical solution and Computational solutions, Red is theory, Black line is derived from difference equation from Trapezoidal method, while Green line is from Z-transform while taking stepsize to be 0.1
